Investment Strategy
Interpreting key concepts and choosing appropriate strategies
Designing your specialized investment strategy

Your goals are as unique as you are.
That’s why your personal investment strategy needs to reflect the following:

• Where you’re headed
• How you plan to get there
• What your specific objectives are
• When you want to achieve them
• What level of risk you’re willing to accept to reach your goals

In this discussion guide, we’ll take a look at how you can use several investment strategies to serve your family’s unique needs. The strategies are broken into two categories—asset allocation and tax efficiency.

Portfolio Review
At Fidelity, we believe:
Investors should begin the portfolio review process by clearly defining their investing goals and time frame, then commit to periodic reviews of their portfolio.

Asset Allocation
At Fidelity, we believe:
• Asset allocation is the single most important factor in assessing the long-term risk-and-return characteristics of a diversified portfolio.

• Efficient portfolio diversification can be one way to lower a portfolio’s risk while maintaining its expected return.

Tax Efficiency
At Fidelity, we believe:
• Overlooking the potential impact taxes can have on investment returns is one of the most common mistakes investors make.

• The type of account in which you hold certain assets can make a major difference in how much you can earn, after tax, over time.
Strategic asset allocation

Build a strategy designed for your needs, and stay committed to it.

Asset allocation is the single most important factor in assessing the long-term risk-and-return characteristics of your portfolio. Research shows that the strategy of selecting the percentage of stocks, bonds, and cash in a portfolio can be said to be responsible for more than 90% of the variability in portfolio returns. Poor asset allocation decisions can cause the returns of the average stock or bond investor to lag the respective markets. You should allocate your investments across stocks, bonds, and cash to help reduce portfolio risk, seek attractive returns, and avoid the pitfalls of market timing. In addition, investors with longer time horizons have the capacity to accept a higher level of portfolio volatility associated with a more significant weighting in equities, which should include broadly diversified international funds to take advantage of diversification benefits outside the United States.

Determining your asset mix.

Your time horizon, current financial situation, and tolerance for market swings will influence how aggressively or conservatively you choose to invest.

UNDERSTAND YOUR RISK TOLERANCE

- Where do you fall on the spectrum of time horizon, current financial situation, and risk tolerance?
- How has your risk tolerance influenced your investment decisions?
Consider portfolio diversification and select your target asset mix.
Portfolio diversification is the mix of stocks, bonds, and cash held in a portfolio. One way to help protect yourself from the unpredictability of the market may be to diversify your holdings across these three main types of investments. This approach can help lower the risks associated with having all your money in only one type of investment.

Your asset mix depends largely on your specific financial situation. Typically, a longer investing time frame allows for a higher percentage of stocks in your portfolio. If you are near retirement you may want to consider a gradual process of transitioning into a lower volatility asset mix. Keep in mind that retirement for some investors could last 30 years or longer, so the growth potential of your portfolio should still be an important consideration when selecting your investment mix.

Q: • What has led you to arrive at your current asset mix?
Consider your asset mix return and volatility trade-offs. Historically, as a portfolio’s stock exposure increases, the potential for both higher returns and larger losses also increases. However, over longer time periods, volatility of returns is reduced.

### ASSET MIX RISK AND RETURN

Here is a chart showing the risk and return of different asset mixes. Each mix is represented by a different color:

- **Short-Term**
- **International Stocks**
- **Domestic Stocks**
- **Bonds**

The chart is based on historical data from 1926 to 2016, covering various asset classes such as domestic stocks, bonds, and foreign stocks.

This chart was prepared by Strategic Advisers, Inc., using data provided by Ibbotson Associates, Inc., as of 12/31/2016. Average annual return data for domestic stocks, bonds, and short-term asset classes range over the period of 1926–2016. Domestic stocks are represented by the S&P 500® Index, which is an unmanaged group of securities and is considered to be representative of the stock market in general. The S&P 500® Index is a registered service mark of The McGraw-Hill Companies, Inc. Bonds are represented by the U.S. Intermediate-Term Government Bond Index. Treasury bills are represented by the 30-day U.S. Treasury bill. Foreign stocks are represented by the Morgan Stanley Capital International Europe, Australasia, Far East Index for the period from 1970 to the last calendar year. Foreign stocks prior to 1970 are represented by the S&P 500® Index. Standard deviation does not indicate how the securities actually performed but indicates the volatility of their returns over time. A higher standard deviation indicates a wider dispersion of past returns and thus greater historical volatility. The chart does not represent the performance of any Fidelity fund. You cannot invest directly in an index. Stock prices are more volatile than those of other securities. Government bonds and corporate bonds have more moderate short-term price fluctuation than stocks but provide lower potential long-term returns. U.S. Treasury bills maintain a stable value if held to maturity, but returns are generally only slightly above the inflation rate. The purpose of the asset mixes is to show how asset mixes may be created with different risk-and-return characteristics to help meet an investor’s goals. You should choose your own investments based on your particular objectives and situation. Remember that you may change how your account is invested. Be sure to review your decisions periodically to make sure they are still consistent with your goals. Past performance is no guarantee of future results. These target mixes were developed by Strategic Advisers, Inc., a registered investment adviser and a Fidelity Investments company. **Asset allocation does not ensure a profit or guarantee against a loss.**
Diversification can help in both up and down markets.
As this chart illustrates, diversification helped limit portfolio losses during the 2008–2009 market decline. It also helped the portfolio achieve gains in the subsequent recovery. This helps illustrate the fact that timing the market should not be your goal. Diversifying your assets to help limit losses during market downturns and capture any gains during recoveries is a prudent approach.

Source: Strategic Advisers, Inc. Hypothetical value of assets held in untaxed accounts of $100,000 in an all-cash portfolio; a diversified growth portfolio of 49% U.S. stocks, 21% international stocks, 25% bonds, and 5% short-term investments; and all stock-portfolio of 70% U.S. stocks and 30% international stocks. This chart’s hypothetical illustration uses historical monthly performance from January 2008 through February 2014 from Morningstar/Ibbotson Associates; stocks are represented by the S&P 500 and MSCI EAFE Indexes, bonds are represented by the Barclays U.S. Intermediate Government Treasury Bond Index, and short-term investments are represented by U.S. 30-day T-bills. Diversification does not ensure a profit or guarantee against a loss.
Tactical allocation

Establishing your asset allocation mix is important, but your investment strategy also needs to take into consideration the sub–asset classes, or the more specific holdings of several categories of assets.

**Stocks**
At the heart of diversification is the concept of correlation, or the measure of how the returns of two investments tend to move together, i.e., whether their returns move in the same or in opposite directions, and to what degree. To build a diversified portfolio, you should consider owning investments across multiple asset classes. This is because different asset classes typically have different risk-return trade-offs.

Because it’s impossible to predict which will outperform, you should diversify not only across asset classes but also within an asset class. For example, within equities, you could have large-, medium-, and small-capitalization stocks; growth and value stocks; and domestic and international stocks.

**Bonds**
Fixed-income investing is a critical component of asset allocation. Diversifying across a broad spectrum of fixed-income issuers, sectors, and maturities may significantly improve your portfolio’s risk-adjusted return while helping to protect it against interest rate changes.

Choosing the appropriate mix

A diversified portfolio will help you find a mix of return versus risk you can remain comfortable with.

It’s important to choose a mix of stocks, bonds, and cash that is appropriate for your investing goals. Take into account your time horizon, your financial situation, and your tolerance for market shifts. This chart illustrates how various asset allocation mixes can affect the levels of risk-and-return potential.

Asset mix performance figures are based on the weighted average of annual return figures for certain benchmarks for each asset class represented. Historical returns and volatility of the stock, bond, and short-term asset classes are based on the historical performance data of various indexes from 1926 through the most recent year-end data available from Morningstar. Domestic stocks represented by S&P 500® 1926–1986, Dow Jones U.S. Total Market 1987–most recent year end; foreign stock represented by S&P 500® 1926–1969, MSCI EAFE 1970–2000, MSCI ACWI Ex USA 2001–most recent year end; short-term represented by 30-day U.S. Treasury bills 1926–most recent year end. It is not possible to invest directly in an index. Although past performance does not guarantee future results, it may be useful in comparing alternative investment strategies over the long term. Performance returns for actual investments will generally be reduced by fees and expenses not reflected in these return figures. Past performance does not guarantee future results. Asset allocation does not ensure a profit or guarantee against a loss.
Portfolio rebalancing

Rebalance on a regular basis so your portfolio’s mix of investments does not shift significantly over time.

**Diversification alone is not enough.** Once you have established a target mix of investments, you should regularly review and rebalance your portfolio. Over time, market performance can shift your portfolio’s allocation, making it either more aggressive or more conservative than you had planned. That’s why you should evaluate your portfolio at least once a year and adjust it, if necessary, to bring it back in line with your targeted mix.

**MONITOR YOUR PROGRESS: REBALANCE**

Q • How often do you review and rebalance your portfolio?
• What has triggered you to do this in the past?

This chart’s hypothetical illustration uses historical monthly performance from April 1995 through August 2016 from Morningstar/Ibbotson Associates; stocks are represented by the S&P 500 and MSCI EAFE Indexes, bonds are represented by Barclays U.S. Intermediate Government Treasury Bond Index, and short-term investments are represented by U.S. 30-day T-bills. Diversification does not ensure a profit or guarantee against a loss.
Disciplined investing

Market timing often works against investors, and jumping in and out of the market typically results in poor returns.

It is important to stick with an asset allocation plan consistent with your time horizon, financial situation, and risk tolerance. Many investors don’t reach their investing goals because they get distracted by rising markets and end up chasing performance and higher-risk investments. On the other hand, during market downturns, many investors move to lower-risk investments and miss out on the opportunities offered by the ensuing market recoveries.

Source: Quantitative Analysis of Investor Behavior (QAIB), 2015, DALBAR, Inc. www.dalbar.com. QAIB uses data from the Investment Company Institute (ICI), Standard & Poor’s and Barclays Capital Index Products to compare mutual fund investor returns to an appropriate set of benchmarks. Covering the period from January 1, 1995, to December 31, 2015, the study utilizes mutual fund sales, redemptions, and exchanges each month as the measure of investor behavior. These behaviors reflect the “average investor.” Based on this behavior, the analysis calculates the “average investor return” for various periods. These results are then compared to the returns of respective indexes. QAIB calculates investor returns as the change in assets, after excluding sales, redemptions, and exchanges. This method of calculation captures realized and unrealized capital gains, dividends, interest, trading costs, sales charges, fees, expenses, and any other costs. After calculating investor returns in dollar terms, annualized return rate is calculated as the uniform rate that can be compounded annually for the period under consideration to produce the investor return dollars. The Barclays Aggregate Index is an unmanaged market-valued index representing securities that are SEC registered, taxable, and dollar denominated. This index covers the U.S. investment-grade fixed-rate bond market, with index components for a combination of the Barclays government and corporate securities, mortgage-backed pass-through securities, and asset-backed securities.

Past performance is no guarantee of future results. Asset allocation does not ensure a profit or guarantee against loss. Performance of an index is not illustrative of any particular investment. It is not possible to invest directly in an index.
Don’t let fears distract you from the market’s opportunities.
We believe investors should generally stay committed to their investing strategy and asset mix, provided their personal situation, including time horizon, financial situation, and risk tolerance, have not changed. As this chart illustrates, the periods of great uncertainty, when many investors feel negative, present some of the best times for long-term investors to position themselves for potential future gains.

Q • How have you reacted to bull and bear markets and general volatility?
Disciplined investing (continued)

Remain focused on long-term goals, not short-term swings.
If you’re investing for retirement, a child’s education, or another long-term goal, you should remain focused on your investment time frame rather than reacting to events and market swings. As the following chart illustrates, moving out of the market may represent a greater risk than staying committed to your strategy.

MISSING OUT ON THE BEST DAYS IN THE MARKET CAN COST YOU

Past performance is not a guarantee of future results. The hypothetical example assumes an investment that tracks the returns of the S&P 500® Index and includes dividend reinvestment but does not reflect the impact of taxes or fees, which would lower these figures. There is volatility in the market and a sale at any point in time could result in a gain or loss. Your own investment experience will differ, including the possibility of losing money. You cannot invest directly in an index. The S&P 500® Index, a market capitalization–weighted index of common stocks, is a registered service mark of the McGraw-Hill Companies, Inc., and has been licensed for use by Fidelity Distributors Corporation. Source: FMRCo, Asset Allocation Research Team as of 5/20/2016.

As this chart illustrates, over a 35-year time period, missing out on the best 10 days in the market would have reduced the value of your portfolio by almost half.
Managing your portfolio

Constructing and maintaining your portfolio requires long-term commitment and attention to detail.

You should review your portfolio regularly—which may mean weekly, monthly, or quarterly. At a minimum, you need to review your financial situation, needs, and objectives annually to make sure your portfolio and positions are properly aligned with your goals.

EXECUTING A CONSISTENT INVESTMENT PROCESS

1. Do your research
   Filter through thousands of investments.

2. Choose investments
   Know what to buy, and when.

3. Monitor your portfolio
   Keep a sharp eye on your investments as markets change.

4. Rebalance
   Make sure your investment mix stays aligned with your goals.

5. Manage for taxes
   Use all the strategies appropriate for you.

Q

- How do you choose your investments?
- How do you decide when and what to buy and sell?

Asset allocation does not ensure a profit or guarantee against a loss.
Tax-efficient investing

Taxes have the potential to significantly affect your investment returns.

One way to help reach your financial goals is to be tax smart with your investments. You can affect your tax bill by paying attention to how and where you generate investment income, dividends, interest, and capital gains and losses. There are three strategies you can use to try to manage the potential impact on your federal income taxes:

- **Defer:**
  Retirement savings accounts—including 401(k) and 403(b) plans, IRAs, health savings accounts (HSAs), and other tax-deferred products such as deferred annuities—all allow you to put off paying taxes.

- **Manage:**
  Using asset location strategies, investing in lower turnover funds, understanding mutual fund distributions, and taking advantage of charitable gifts and capital loss deductions can all help you manage your tax burden.

- **Reduce:**
  Consider tax-free investments, municipal bonds, HSAs, and college savings accounts to help reduce your taxes.

The overall impact of taxes on performance is significant: Morningstar cites that, on average, over the 87-year period ending in 2015, investors gave up between one and two percentage points of their annual returns to taxes. A hypothetical stock return of 10.0% that fell to 8.0% after taxes would, in effect, have left the investor with 2% less investment income in his or her pocket, according to Morningstar. Although these findings vary based on changing market conditions, potential tax consequences are always looming. Simply put, taxes shouldn’t be ignored.

Asset location

Place your investments where they may help enhance returns, in concert with your goals and overall portfolio.

With an asset location strategy, you position the most tax-efficient investments that typically generate the least taxable income—such as municipal bonds, low-turnover stock funds, or exchange-traded funds—in taxable accounts, because of their low-tax-generation characteristics.

Conversely, relatively tax-inefficient assets—such as taxable bonds, high-turnover stock funds, or real estate investment trusts—may be better kept in tax-advantaged accounts like 401(k) plans, IRAs, and tax-deferred variable annuities. Of course, you also need to consider your overall asset allocation and investment time frame before making any changes.

As outlined in this table, you should consider putting the more tax-efficient investments in taxable accounts, and the less tax-efficient investments into tax-deferred and tax-free accounts.

MA More Appropriate  A Appropriate  LA Less Appropriate

For illustrative purposes only. Investing in a variable annuity involves risk of loss—investment returns and contract value are not guaranteed and will fluctuate.

*May be A in the case of Treasury securities/funds for high-income residents of states with high state income tax.
Tax-loss harvesting

A powerful way to help you keep more of what you earn.

With tax-loss harvesting, you sell an investment in a capital asset—such as a stock or bond—for a loss and use that to offset current or future realized gains and/or income. In addition, each taxpayer is allowed to use up to $3,000 of net capital realized losses to offset ordinary income each year. Any realized losses not used in a given tax year can be carried forward and used in future years. This strategy, which is typically most effective during volatile markets, especially during downturns, can help reduce your tax bill.

Tax-loss harvesting may feel counterintuitive, because the goal of investing is to make money, not to lose it. But everyone experiences investment losses from time to time. If handled properly and consistently, tax-loss harvesting can potentially improve your overall after-tax returns. The challenge is that this strategy requires disciplined reinvestment of the loss proceeds, diligent investment tracking, and detailed tax accounting.

Tax savings will depend on an individual’s actual capital gains, loss carryforwards, and tax rate, and may be more or less than this example. This is a hypothetical example for illustrative purposes only and is not intended to represent the performance of any investment. S&P 500® Index data, FMRCo, May 28, 2013.
Tax-sensitive investment management
Take advantage of techniques designed to help reduce taxes on investment returns.

Proper management of your investments with an eye toward the tax implications has the potential to significantly increase the value of your portfolio over time. You should consider employing a select blend of tax-sensitive management strategies, including harvesting tax losses, to help reduce the negative impact of taxes on your portfolio’s overall return. You can also defer the realization of short-term gains in favor of seeking long-term capital gains, as appropriate. And consider managing your portfolio’s exposure to fund distributions that can have costly tax implications, or investing in municipal bond funds, and national or state-specific bond funds. You can employ these strategies on your own or work with a tax-sensitive money manager who can do it for you.

(SAI) applies tax-sensitive investment management techniques in connection with Fidelity Personalized Portfolios (including “tax-loss harvesting”) on a limited basis, at its discretion, primarily with respect to determining when assets in a client’s account should be bought or sold. As a discretionary investment manager, SAI may elect to sell assets in an account at any time. A client may have a gain or loss when assets are sold. SAI does not currently invest in tax-deferred products, such as variable insurance products or tax-managed funds, but may do so in the future if it deems such to be appropriate for a client. SAI does not actively manage for alternative minimum taxes, state or local taxes, foreign taxes on non-U.S. investments, or estate, gift, or generation-skipping transfer taxes. SAI relies on information provided by clients in an effort to provide tax-sensitive investment management, and does not offer tax advice. SAI can make no guarantees as to the effectiveness of the tax-sensitive investment management techniques applied in serving to reduce or minimize a client’s total tax liabilities or to tax results that may be generated by a given transaction. Clients are responsible for all tax liabilities arising from transactions in their accounts, for the adequacy and accuracy of any positions taken on tax returns, for the actual filing of tax returns, and for the remittance of tax payments to taxing authorities.

3 Taxes Can Significantly Reduce Returns data, Morningstar, Inc., 2014. Federal income tax is calculated using the historical marginal and capital gains tax rates for a single taxpayer earning $110,000 in 2010 dollars every year. This annual income is adjusted using the Consumer Price Index in order to obtain the corresponding income level for each year. Income is taxed at the appropriate federal income tax rate as it occurs. When realized, capital gains are calculated assuming the appropriate capital gains rates. The holding period for capital gains tax calculation is assumed to be five years for stocks, while government bonds are held until replaced in the index. No state income taxes are included. Stock values fluctuate in response to the actual financial performance of the individual companies and the general economic conditions, among other factors. Classes of assets such as stocks are more volatile than bonds or short-term instruments. Government bonds and corporate bonds have more moderate short-term price fluctuations than bonds, but provide lower potential long-term returns. U.S. Treasury bills maintain a stable value if held to maturity, but returns are generally only slightly above the inflation rate. Though bonds generally have less volatility than stocks (as interest rates rise, bond prices usually fall, and vice versa), issuer credit risk, and the risk of default, or the risk that an issuer will be unable to make income or principal payments. The effect of interest rate changes is usually more pronounced for longer-term securities. Additionally, bonds and short-term investments entail greater inflation risk, or the risk that the return of an investment will not keep up with increases in the prices of goods and services, than stocks.
