Market Volatility is Normal: Staying the Course is Critical

While market volatility can be unsettling, historically, the market has recovered from intra-year declines and provided positive returns for investors over time.

A positive long-term trend
Since 1980, the S&P 500® Index return was positive in 35 of the last 42 years, or more than 83% of the time. Over that same period the index has returned an average of 14% per year.

Market declines throughout the year are not unusual
Despite this positive long-term trend, it is important to highlight that intra-year declines of more than -10% are quite normal. On average, the largest drop in price from peak to trough for the index in any given calendar year has been about -14% over this same period.

Patience and discipline may lead to long-term gains
Investors who resist the urge to react to market volatility may benefit from the potential recoveries that could follow. That’s why we believe in sticking with your long-term investment plan to help you reach your financial goals.

Intra-year decline is the difference between the highest and lowest point in the market during that year

Generally, among asset classes, stocks are more volatile than bonds or short-term instruments and can decline significantly in response to adverse issuer, political, regulatory, market, or economic developments. Although the bond market is also volatile, lower-quality debt securities, including leveraged loans, generally offer higher yields compared with investment-grade securities, but also involve greater risk of default or price changes. Foreign markets can be more volatile than U.S. markets due to increased risks of adverse issuer, political, market, or economic developments, all of which are magnified in emerging markets.
